### **ABSTRACT**

*Brand equity is one of the more popular concepts in marketing today. It is the added value that a brand brings to a product or service beyond the functional benefits provided. Advertising is an effective and powerful marketing tool adopted by marketers to create and promote awareness for their products or brands. Among the many forms of advertising celebrity advertisement is more popular and attractive. Celebrities are famous figures who enjoy public reputation on behalf of consumer goods. All over the world celebrities as spokespersons have been used for promoting wide varieties of brands. The aim of the paper is to analyse how far the presence of a celebrity in an advertisement enhances brand equity. Five key attributes of the celebrity is analysed against the various components of brand equity and the result reveals that the celebrity endorsement acts as an effective source of promoting brand equity.*

**Keywords:** Attractiveness, Brand Equity, Brand Loyalty, Celebrity, Endorsement, Expertise.

## **INTRODUCTION:**

In the modern era of information and communication explosion and media influence, advertisements play a major role in shaping the thinking of a consumer. Brand equity is the financial value associated with a brand. In modern competitive world it is not easy to build brand equity. Companies can enhance the brand equity for their products or brands by making them unforgettable by adopting the services of various types of celebrities. High brand equity gives a company the highly desired competitive advantages. Brand provides value to customers by enhancing interpretation or processing of information, confidence in the purchase decision and use satisfaction. Now a days good number of companies are utilizing the services of famous personalities like sports stars and film stars to promote brand equity. Companies are spending huge amount for getting celebrities for endorsement process. The health of a brand can definitely be improved up to a great extent by endorsement process. Presence of a famous figure in an advertisement enhances the brand equity by promoting brand recognition, brand recall, brand preference, brand insistence and brand loyalty being the core components of brand equity. India is a developing country flooded with many brands. A brand is something that resides in the minds of consumers. Brand has the significant value for both the manufacturer as well as consumers. Companies find it difficult to differentiate their products or brand from competitor's brand. To make an advertisement more effective and dynamic, companies use different celebrities to endorse their brands. Using spokespersons as endorsers promote quick brand recall, brand recognition, brand insistence, brand performance and brand loyalty. In short celebrities add a new dimension to the brand. As a result of the increase in celebrity endorsements in various media, India has become a celebrity obsessed society. In order to evaluate how far the celebrity endorsement acts as a source of promoting brand equity, number of variables were identified from the literature and to select the prominent factors, exploratory factor analysis (EFA) was performed by using SPSS 21.0 Version and on the basis of the factor loading the following variables were selected for the study:

- Brand recognition
- Brand recall
- Brand preference
- Brand insistence and
- Brand loyalty

## **REVIEW OF LITERATURE:**

Murugananthan and Kaliyamoorthy (2009) noticed that effective use of celebrities in advertisement enhances the brand's position in the minds of consumers. They pointed that celebrities must be honest and should provide genuine information about the product or brand. A good number of consumers believe that celebrities do not use the endorsed products themselves. Their study was limited to the female personal care products only.

Pugazhanti A et al. (2011) pointed that celebrity endorsed advertisement for a durable product is more convincing than an advertisement without such endorsement. Celebrity based advertisement enhances the buyer belief of want satisfaction. They also pointed that celebrity based advertisements enhances brand awareness and recall. Finally they understood that the purchase attitude of a consumer is very much influenced by the celebrity endorsement factors, product evaluation and brand recognition.

Virendra Chavda (2012) made an attempt to measure the role and effectiveness of celebrity advertisement from the consumers point of view with consideration of factors like effectiveness of celebrity advertisement in terms of creating an impression, attracting audiences, survival in competition, purchase intention of customers after watching an advertisement, recall value of the advertisement, tempting the customers to spend more, creating an impression on others by using a particular product etc. It is found that celebrity advertisement is effective as it has positive impact on various factors, which are essential reasons for a company to advertise in any media.

Singh, Aggarwall (2012) identified that children are manipulated by celebrities version that product will do something special for them, which will transform their life. Various celebrities like film actors, sports

person and well known persons are shown in the advertisements to promote the various products and services. Children imitate them after coming to know their life styles through such advertisements. They wonder, get fascinated and always think of emulating them. As role models, celebrities are capable of influencing many facets of children buying behaviour. They identified the effects of celebrities on three age groups of children belonging to urban and rural areas. The result shown that children of all age groups are careful about the celebrity endorsements in advertising but are strongly influenced by the presence of celebrities in advertisements as they like their presence and mostly try to buy the products which are promoted by them.

Srinivas (2013) investigated the consumers' attitude towards the brand celebrity advertisement and their intention to purchase the advertised product. The dependent variables like purchase intentions attitude towards the advertisement and celebrity were measured against the independent variables source of information, essential features and celebrity qualities using one way ANOVA and Chi Square test. The result of the study was the celebrity endorsement generated higher purchase intention, positive attitude towards the advertisement and brand.

Hyum Um (2013) investigated the relationship between negative brand publicity and a celebrity endorser. The study found that negative brand publicity had negative impacts on the celebrity endorser, brand evaluation and purchase intention. It explored two things ie. whether identification with a celebrity moderates the relationship between negative brand publicity and evaluation of a celebrity endorser and a brand.

Hayat et al. (2014) inferred that role of celebrities in advertisement is influential on the customer stimulation decision. The purchase decision of a customer is strongly influenced by celebrity and related factors. Marketers can utilize the famous celebrities to capture the wide market share. The study implied that brand acceptance and celebrity advertisement can be positively correlated.

Jayapalan (2015) studied about the perception of Indian consumers on celebrity endorsement and its influence on purchase decision. The study revealed that celebrity endorsement impacts significantly on purchase intention of consumers and expertise of the celebrity and popularity of the celebrity plays a crucial role in information processing. Majority of the respondents opines that the quality of celebrity endorsed products is higher and it adds brand equity to the product. The study also pointed that celebrity endorsement promotes brand equity and has the ability to influence the buying behaviour of consumers.

Shaista Kamal Khan et al. (2016) evaluated the influence of celebrity endorsement on consumer purchase intention and pointed that celebrity endorsement has strong effect on marketing creations. The study was conducted in Pakistan and the right choice of the celebrity is highly profitable in Pak context. In order to develop new brands the firms can adopt the services of experienced, attractive and less expensive models to promote awareness about the product or brand. They also found that the personality of celebrity endorser is also influencing the brand's success. It was proved in Pakistan context that the introduction of celebrities in advertisement influence the purchase intention and buying behaviour.

### **OBJECTIVE OF THE PAPER:**

- To examine the influence of celebrity endorsement on components of brand equity

### **HYPOTHESIS:**

In order to fulfil the above objectives the following null hypothesis is developed and tested.

**H<sub>0</sub>:** Celebrity endorsement is not an effective source of brand equity

### **METHODOLOGY:**

The study is based on both secondary and primary data. The secondary data required for the study have been collected from various sources like books, journals, magazines, reports and working papers. In order to evaluate how far celebrity endorsement acts as a source of brand equity, the key attributes of the celebrity namely, attractiveness, expertise, trustworthiness, match up factor and popularity is considered as independent variable and the components of brand equity is selected as

dependent variable. The study mainly used primary data for drawing inferences collected from 180 sample customers of selected districts. The consumers of Kerala (male and female) have been identified as the universe of the study. A pre- tested interview schedule was used for collecting data from the select consumers. A pilot study was conducted to test the questionnaire. After the pre-test, questionnaire was modified by way of adding some relevant statements and deleting some unwanted statements.

### **SAMPLE DESIGN:**

The population of the study consisted of the consumers of various products of Kerala namely, Fast Moving Consumer Goods, household durables, readymade garments and Jewelry items. As the population is infinite and spread throughout the state of Kerala, it is quite difficult to conduct a population survey. Hence the multi-level sampling technique was adopted to select the required number of respondents from different parts of Kerala. In the first level the fourteen districts of Kerala were divided in to three regions namely, Southern Region, Central Region and Northern Region. Southern region consists of Thiruvananthapuram, Kollam and Alappuzha districts. Central region consists of Kottayam, Eranakulam Idukki and Thrissure districts. Northern Region includes Malappuram, Calicut, Waynad, Palakkad, Kannur, and Kasarkode. In the second level three metropolitan districts were selected. The districts selected for the study were Thiruvananthapuram from south Ernakulam from central and Calicut from the north. Most of the villas, malls, flats, trade and industries are concentrated on these three districts of Kerala. More over Consumers of these districts show a diversified behaviour in purchase. In the third level, from the districts selected one corporation, municipality and panchayath each were selected on random basis. Trivandrum, Neyyattinkara and Vellarada from Trivandrum districts, Eranamkulam, Aluva and Edathala from Eranakulam district and Kozhikode, Ramanatukara and Mavoor from Calicut district were selected for data collection. The detailed sample frame is presented below:

**Table 1: Sampling Frame**

| SI No.       | Zone & Sample District           | Corporation        | Municipality          | Panchayath        | Total      |
|--------------|----------------------------------|--------------------|-----------------------|-------------------|------------|
| 1.           | South Zone<br>Thiruvananthapuram | Trivandrum<br>(20) | Neyyattinkara<br>(20) | Vellarada<br>(20) | 60         |
| 2.           | Central Zone<br>Eranamkulam      | Cochin<br>(20)     | Aluva<br>(20)         | Edathala<br>(20)  | 60         |
| 3.           | North Zone<br>Calicut            | Calicut<br>(20)    | Ramanatukara<br>(20)  | Mavoor<br>(20)    | 60         |
| <b>Total</b> |                                  |                    |                       |                   | <b>180</b> |

### **RELIABILITY ANALYSIS:**

Prior to analysing the relationship between variables under study, the strength of the scale was evaluated by examining its reliability. The instrument was then subjected to the computation of Cronbach's co-efficient alpha (Cronbach, 1951). In reliability analysis the alpha coefficient was evaluated to find out the internal consistency of the items on the scale. Reliability refers that a scale generates the same result if measurements are repeated. In order to verify the internal consistency of the scaled statements, reliability analysis using Cronbach's Alpha Reliability test was done. Cronbach's alpha for these selected statements were 0.852 which is higher than the standard cronbach's alpha of 0.7. Hence it is proved that internal consistency of the scale and the questionnaire can be considered as reliable. The table depicted below shows the item wise Cronbach Alpha:

**Table 2: Reliability Statistics**

| <b>Variables</b>                  | <b>No. of items</b> | <b>Cronbach's Alpha</b> |
|-----------------------------------|---------------------|-------------------------|
| <b>Attributes of Celebrity</b>    |                     |                         |
| Attractiveness                    | 8                   | 0.862                   |
| Trustworthiness                   | 5                   | 0.812                   |
| Expertise                         | 5                   | 0.833                   |
| Popularity                        | 6                   | 0.824                   |
| Match up factor                   | 4                   | 0.833                   |
| <b>Components of Brand Equity</b> |                     |                         |
| Brand recognition                 | 4                   | 0.846                   |
| Brand recall                      | 6                   | 0.852                   |
| Brand preference                  | 5                   | 0.844                   |
| Brand insistence                  | 5                   | 0.856                   |
| Brand loyalty                     | 5                   | 0.851                   |

**Source:** Primary Data

**FACTOR ANALYSIS:**

Factor analysis is a technique used to identify a smaller number of factors underlying a large number of observed variables. Variables that have high correlation between them and are largely independent of other subset of variables were combined into factors. To explore the underlying dimensions, exploratory factor analysis was done. Principal component analysis with varimax rotation was used to reduce the number of variables. The factor analysis is based on correlation between variables, so the factorability of data was identified by using KMO and BTS. If the Kaiser Meyer Olkin measure of sampling adequacy is greater than 0.6, the data is factorable (Tabachnick & Fidell, 2007). The Barlett's Test of Sphericity (BTS) value is significant, if p value is less than 0.5. The following table shows the value of KMO and BTS:

**Table 3: KMO and Bartlett's Test**

| <b>KMO and Bartlett's Test</b>                   |                    |           |
|--|--------------------|-----------|
| Kaiser-Meyer-Olkin Measure of Sampling Adequacy. |                    | .873      |
| Bartlett's Test of Sphericity                    | Approx. Chi-Square | 17559.754 |
|  | Df                 | 300       |
|  | Sig.               | .000      |

**Source:** Field Survey

KMO for overall matrix was found to be excellent (0.873) which is greater than 0.6 ((Tabachnick & Fidell, 2007).) and Barlett's test of sphericity (BTS) value is found significant (p<0.000) which meant that data is appropriate for Exploratory Factor Analysis (EFA). The details of factor analysis are presented below:

**Table 4: Total Variance Explained**

| 19                       | .079                 | .314          | 98.958       |                                     |               |              |                                   |               |              |
| 20                       | .070                 | .281          | 99.239       |                                     |               |              |                                   |               |              |
| 21                       | .053                 | .212          | 99.451       |                                     |               |              |                                   |               |              |
| 22                       | .041                 | .165          | 99.616       |                                     |               |              |                                   |               |              |
| 23                       | .038                 | .152          | 99.767       |                                     |               |              |                                   |               |              |
| 24                       | .035                 | .142          | 99.909       |                                     |               |              |                                   |               |              |
| 25                       | .023                 | .091          | 100.000      |                                     |               |              |                                   |               |              |

**Extraction Method:** Principal Component Analysis.

Table 4 indicates the extraction of factor loading. Principal component analysis is used and five components are extracted towards the celebrity endorsement. The result shows that 87.182% of the total variance is explained by five factors. The most contributing factor based on the above table is Brand recall followed by brand preference, brand insistence, brand loyalty and brand recognition. The table presented below explains the rotated component factor loadings of each factor.

**Table 5: Rotated Component Matrix**

| Rotated Component Matrix <sup>a</sup> |                              |           |   |   |   |   |
|---------------------------------------|------------------------------|-----------|---|---|---|---|
| Variables                             | Indicators/<br>Statements    | Component |   |   |   |   |
|                                       |                              | 1         | 2 | 3 | 4 | 5 |
| Brc1                                  | Beauty of the celebrity      | .902      |   |   |   |   |
| Brc2                                  | Reputation of the celebrity  | .895      |   |   |   |   |

| Brg1                                  | Beauty of the endorser           |           |      |      |      | .873 |
| Brg2                                  | Charisma of the endorser         |           |      |      |      | .871 |
| Brg3                                  | Reliability of the endorser      |           |      |      |      | .859 |
| Brg4                                  | Fame of the celebrity endorser   |           |      |      |      | .834 |

**Extraction Method:** Principal Component Analysis.

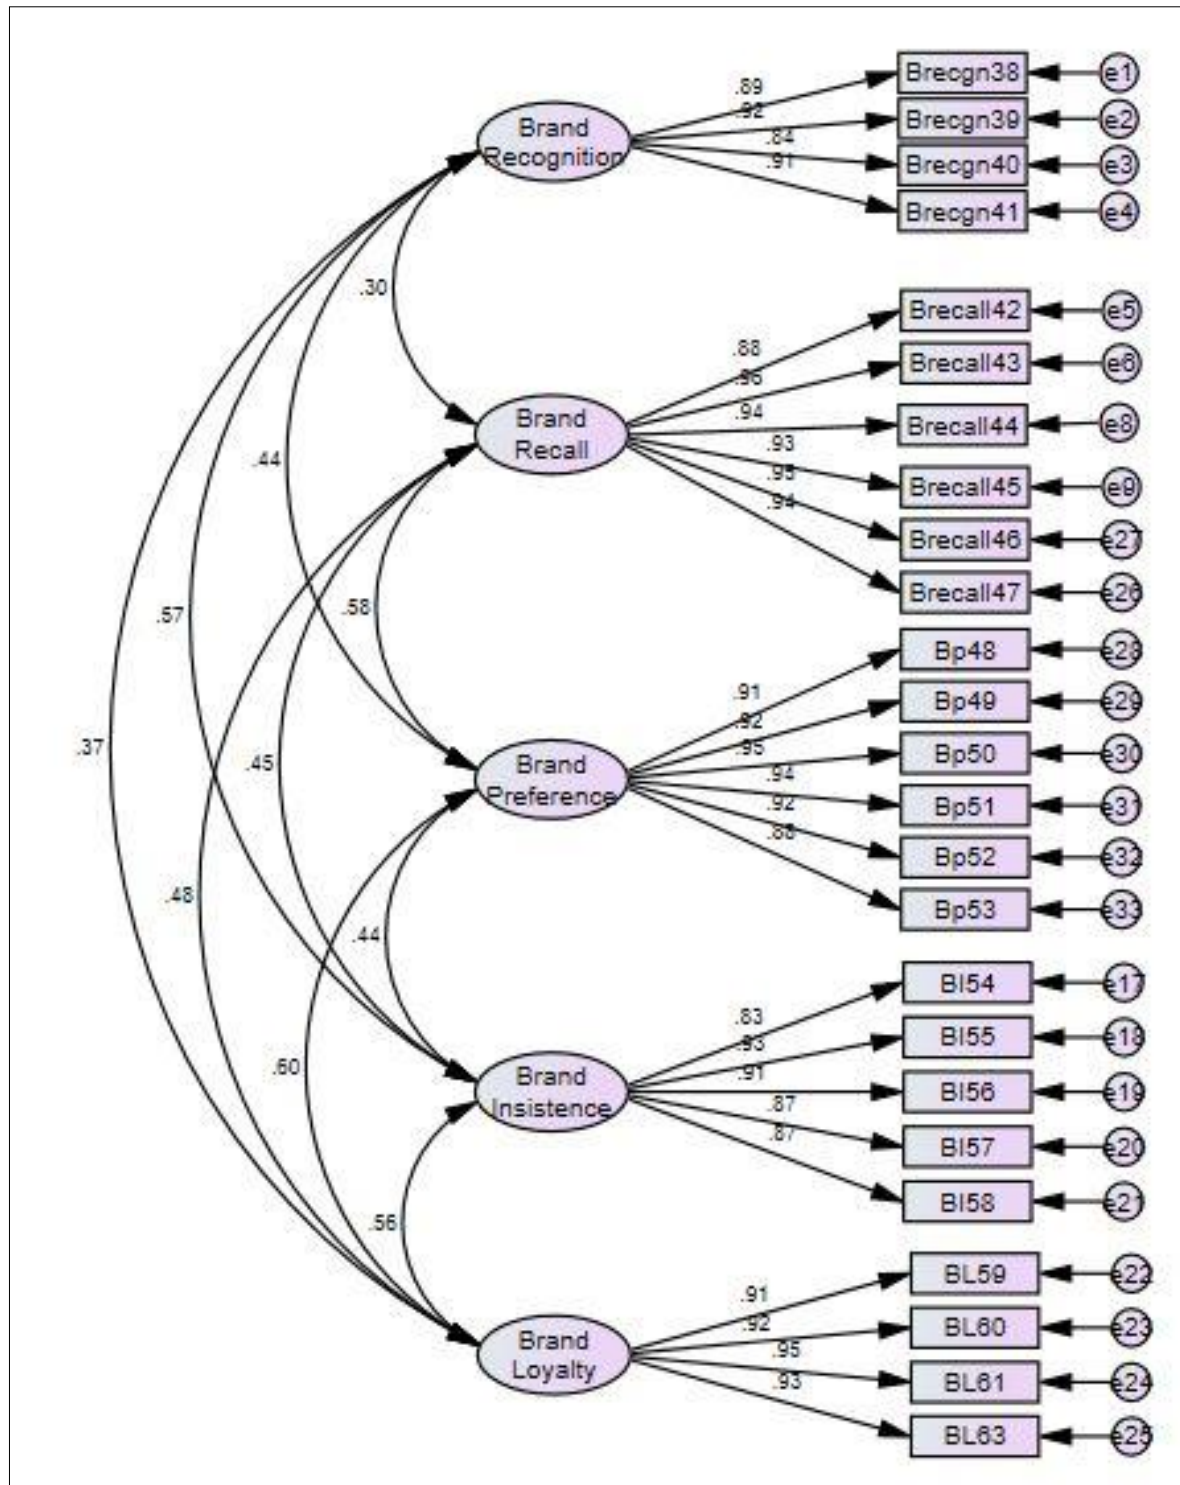

**Rotation Method:** Varimax with Kaiser Normalization.

Table 5 shows the rotated factor matrix. Variables with factor loadings above .70 were selected for analysis. After performing Varimax Rotation Method in Kaiser Normalization, factor 1 comprised of six items or variables named as brand preference. The items in factor 1 are Brc1, Brc2, Brc3, Brc4, Brc5 and Brc6. In factor brand recognition, the item Brc1 showed more (.902) loading followed by Brc2 (.895) and Brc 6 is the least loading factor. Factor 2 comprises of 6 items named as brand preference with factor loading ranging from .813 to .878. The items in factor 2 are Bp1, Bp2, Bp3, Bp4, Bp5 and Bp6. Factor 3 consisted of 5 items with factor loading ranging from .808 to .846. The factor is named as Brand insistence. The items involved in this factor are Bi 1, Bi 2, Bi 3, Bi 4 and Bi 5. In factor 4, four items are involved and factor loading ranges from .829 to .864. Factor 4 is named as brand loyalty. The items involved in factor 4 are B11, B1 2, B1 3 and B1 4. Factor 5 is named as brand recognition with 4 items namely, Brg1.Brg 2, Brg3 and Brg4.

**Confirmatory Factor Analysis (CFA):**

Confirmatory Factor Analysis (CFA) is a type of statistical technique used to verify the factor structure of a set of observed variables. Structural Equation Modeling software is typically used for performing confirmatory factor analysis. The researchers used CFA as a first step to assess the proposed Measurement model in a structural equation model. The following figure shows the Confirmatory Factor Analysis of Celebrity Endorsement and Brand Equity.

**Figure 1: Confirmatory Factor Analysis**

Measurement model of celebrity endorsement and brand equity was tested by a Confirmatory Factor Analysis by using Amos 21.0. This measurement model is developed to test how far the celebrity endorsement acts as a source of brand equity. The construct brand equity consists of five components like brand recognition, brand recall, brand preference, brand insistence and brand loyalty. Reliability of the scale developed for the study was confirmed by using Cronbach's alpha value method and which were found to be significant. The model fit indices are presented in the table below:

**Table 6: Model Fit Indices**

| Sl. No | Indices of Common Fit                           | Value | Value of Good Fit |
|--------|---|-------|-------------------|
| 1.     | Comparative Fit Index (CFI)                     | 0.991 | >0.90             |
| 2.     | Goodness of Fit Index (GFI)                     | 0.936 | >0.90             |
| 3.     | Incremental Fit Index (IFI)                     | 0.991 | >0.90             |
| 4.     | Tucker Leiw's Index (TLI)                       | 0.984 | >0.90             |
| 5.     | Normed Fit Index (NFI)                          | 0.982 | >0.90             |
| 6.     | Root Mean Square Error of Approximation (RMSEA) | 0.046 | <0.05             |

Table shows the different model fit indices of confirmatory factor analysis. In general, model fit indices of greater than 0.09 and Root Mean Square Error of Approximation (RMSEA) less than 0.05 indicates a close fit between the model and the data. The present scale developed for the study was supported by the result of the Confirmatory Factor Analysis. Hence all the fit indices are satisfactory and appropriate for the scale, the Confirmatory Factor Analysis confirms the structure of measurement scale.

**RESULTS AND FINDINGS:**

**Celebrity Endorsement and Brand Equity:**

Using well reputed and admired people to promote brand is a commonly accepted phenomenon which brings quick attention to the brand and shapes the perception of the brand by virtue of the inferences. The credibility of a celebrity endorser (Attractiveness, Expertise, and Trustworthiness) has indirect impact brand equity (Ravi Pappu et al.2011). In order to measure how far celebrity endorsement acts as a source of brand equity, a null hypothesis formulated was celebrity endorsement is not much effective as a source of brand equity and tested by using regression analysis. The result is presented below:

**Table 7: Model Summary**

| Model Summary |                   |          |                   |                            |
|---------------|-------------------|----------|-------------------|----------------------------|
| Model         | R                 | R Square | Adjusted R Square | Std. Error of the Estimate |
| 1             | .778 <sup>a</sup> | .605     | .600              | .29132                     |

**Predictors:** (Constant), match up, Expertise, Attractiveness, Trustworthiness, Popularity

**Source:** Field Survey

Table 7 provides the R and R square values. The R value represents the simple correlation and is 0.778 (The "R" Column), which indicates a good degree of correlation. The R square value (the "R Square Column) indicates how much of the total variation in the dependant variable, 'Brand Equity', can be explained by the independent variable (Attractiveness, Expertise, Trustworthiness, Popularity, Match up Factors). In this case, 60.5% can be explained, which is considered good for social science researches. There are a lot of factors influencing the term brand equity like perceived quality of the product, perceived risk, variety, evoked feelings, traditions, advertisements, packaging, and price and country origin. The factor governing brand equity also depends on the nature of the product and types of consumers. From the analysis it is clear that it cannot say the celebrity endorsement alone acts as a source of brand equity but it plays a crucial role in promoting brand equity. The following ANOVA table shows the significance between these variables.

**Table 8: ANOVA – Celebrity Endorsement and Brand Equity**

| ANOVA <sup>a</sup> |              |                |            |             |         |                   |
|--------------------|--------------|----------------|------------|-------------|---------|-------------------|
|                    | Model        | Sum of Squares | Df         | Mean Square | F       | Sig.              |
| 1                  | Regression   | 61.501         | 5          | 12.300      | 144.938 | .000 <sup>b</sup> |
|                    | Residual     | 40.226         | 474        | .085        |         |                   |
|                    | <b>Total</b> | <b>101.727</b> | <b>479</b> |             |         |                   |

**Dependent Variable:** BE

**Predictors:** (Constant), matchup, Expertise, Attractiveness, Trustworthiness, Popularity

**Source:** Field Survey

As per table, p value is less than 0.05; the regression model predicts the dependent variable significantly well. Hence it could be realized that the celebrity endorsement in total acts as a source of brand equity and the relationship between independent variables (Celebrity endorsement attributes) and the dependent variable is positively significant at 5% level. The regression co efficient of all the variables is presented below:

**Table 9: Regression Coefficients**

| Coefficients <sup>a</sup> |                 |                             |            |                           |        |      |
|---------------------------|-----------------|-----------------------------|------------|---------------------------|--------|------|
| Model                     |                 | Unstandardized Coefficients |            | Standardized Coefficients | T      | Sig. |
|                           |                 | B                           | Std. Error | Beta                      |        |      |
| 1                         | (Constant)      | 1.697                       | .112       |                           | 15.194 | .000 |
|                           | Attractiveness  | .202                        | .024       | .308                      | 8.461  | .000 |
|                           | Expertise       | .118                        | .030       | .153                      | 3.943  | .000 |
|                           | Trustworthiness | .084                        | .027       | .123                      | 3.102  | .002 |
|                           | Popularity      | .053                        | .029       | .082                      | 1.828  | .050 |
|                           | Match up        | .169                        | .024       | .312                      | 7.007  | .000 |

**Dependent Variable: BE**

**Source: Field Survey**

All the predictions from the above table 9 are positive and significant at 5 per cent level. The table shows the regression co efficient for the model. The Colum B shows the un standardized regression co efficient for the equation. The equation can be constructed as follows:

$$Y = 1.697 + .202x_1 + .118x_2 + .084x_3 + .053x_4 + .169x_5$$

From the table it can be observed that attractiveness of the celebrity, expertise and popularity of the celebrity, trustworthiness and match up factor were significantly contributing to brand equity hence the beta value is positive. So it can be interpreted from the analysis that the celebrity endorsement acts as a source of brand equity.

**CONCLUSION:**

Famous figures in advertisement plays a pivotal role in promoting brand equity. Recently this practice has been noteworthy and its impact on people is unparallel. Brand equity is the marketing and financial value associated with a brand. Here an attempt was made to evaluate how far celebrity endorsement acts as a source of brand equity. The result of the regression analysis revealed that the celebrity endorsement plays a crucial role in promoting brand equity. It is proved from the analysis that the various attributes of the celebrity like attractiveness, expertise, popularity, trustworthiness and match up factor were contributing much to the promotion of brand equity.
